STUDENT TEAM WEEKLY REPORT

PROJECT / FEATURE	TEAM & MENTOR	WEEK / LEADER
Question Bank & Quiz Engine [Integration — Analytics & Reports]	TEAM ID : 2 FACULTY MENTOR: Mr. Rudragouda Patil	WEEK ENDING: 28/09/2026 STUDENT LEADER: Pratiksha Chavan.

WORK COMPLETED	CHALLENGES / RISKS	HELP NEEDED
• **Dashboard integration:** Reviewed the admin.html Analytics & Reports view against GET /api/analytics/overview (participation, average score, pass rate, completion rate), which AnalyticsEngine computes from the shared results registry. • **Report dimensions & export:** Traced the Student / Class / Subject / Quiz-wise tabs to GET /api/analytics/reports?dimension=…; spreadsheet export uses &format=csv, and PDF uses the browser Print / Save option. • **Question & topic insights:** Mapped GET /api/analytics/items (accuracy, discrimination index, Weak / Overly Easy flags) and /topics (weak topic below 50% mastery) to admin.html and the faculty analytics section in author.html. • **Trend view:** Reviewed how GET /api/analytics/trends feeds the quiz-cycle cards on the admin dashboard. • **Route check:** Confirmed all five /api/analytics/* routes are registered in AppServer.java.	• **Static trends:** /api/analytics/trends returns four fixed cycles, not values computed from quiz results, so multi-cycle trend analysis is not yet working. • **Fixed dashboard values:** completionRate is set to 96 whenever any attempt exists, and enrolled students is fixed at 60. • **Hard-coded grouping:** Class (TY-IT-A/B) is assigned by three student names, subjects are limited to CS301/CS302 by title keyword, and the subject "weak topics" count is fixed. • **Data source & access:** Analytics read the in-memory results registry (Week 6 gap, includes seeded sample records) and /api/analytics/* has no authentication check. • PDF export depends on browser print; analytics endpoints are not yet in the integration tests or README.	• **Decision needed from Backend team**: For the final demo, should completion rate, class mapping and cycle trends be computed from stored attempts, or shown as the current seeded demo values? • Database team to confirm which user fields (department, division) can supply class and enrolment data.

INTEGRATION AND COLLABORATION	COMMON KPI EVIDENCES
Interfaces Used: GET /api/analytics/overview, /items, /topics, /trends, /reports (dimension, format=csv); admin.html, author.html; AnalyticsEngine reading AppServer results. **Dependencies (open):** • Backend team — replace fixed completion, enrolment, class and trend values with computed data. • Database team — class/division and enrolment source for class-wise reports. • Frontend team — confirm PDF via browser print is acceptable for the demo. **Pipeline Learnings:** student.html result → POST /api/quiz-results → in-memory registry → AnalyticsEngine → /api/analytics/* → admin and author dashboards. Analytics accuracy therefore depends on fixing result storage from Week 6.	• **Foundational Behavior:** No latency or CPU measurements for /api/analytics/* exist in the available evidence. • **Continuous Integration:** start_app.sh builds and launches AppServer with the analytics routes; test_api_endpoints.py does not yet cover them. • **Automation:** AnalyticsEngine computes item accuracy, discrimination index (upper vs lower 27%) and topic mastery from stored responses. • **Collaborative Delivery:** integration_config.json and the Integration README do not yet list the analytics endpoints.

NEXT WEEK COMMITMENTS	MENTOR RESPONSE
• Kartik Manoj: Add analytics endpoint tests (overview, items, topics, trends, reports CSV) to test_api_endpoints.py and capture output. • Anagha Thavkar: Work with Backend to compute completion rate, class mapping and trends from stored attempts. • Shruti Chavan: Add authentication to analytics endpoints and verify role access. • Pratiksha Chavan: Update integration_config.json and README with analytics endpoints; check PDF print output.
