STUDENT TEAM WEEKLY REPORT

PROJECT / FEATURE	TEAM & MENTOR	WEEK / LEADER
Question Bank & Quiz Engine User and Role Management - Database Foundation	**TEAM ID:** 1 **FACULTY MENTOR:** Mr. Rudragouda Patil	**WEEK ENDING:** 09/08/2026 **STUDENT LEADER:** Ved Panchwadkar

WORK COMPLETED	CHALLENGES / RISKS	HELP NEEDED
• Defined the core user and access-control tables in **Database.sql**: `user`, `role`, `user_role`, and `audit_log`. • Included account fields for username, unique email, password hash, reset-token data, last-login timestamp, status, division, department, and contact number. • Added the role catalogue for roles such as Teacher, Student, Admin, Moderator, and Author, with a junction table for user-role assignments. • Specified primary keys and foreign keys to connect user-role assignments and audit entries to user accounts. • Identified profile maintenance, secure login/reset, and role-based access as the initial account-management requirements. **Evidence: Database.sql user/role DDL; account-field list; user_role and audit_log relationship definitions.**	**Amber:** Password hashing, reset-token expiry, and account-state transitions require application-level validation. **Amber:** Login-attempt history and session duration are not represented by dedicated tables in the supplied schema. **Green:** Core account and role relationships are defined.	**Technical Guidance Request:** Review the role-permission model, secure password-reset flow, and the intended lifecycle for account status and reset tokens.

INTEGRATION AND COLLABORATION
• Aligned user identifiers as foreign-key references for role assignments, audit entries, question authors/moderators, and quiz creators. • Shared profile fields (division, department, and contact number) for later user-management and division-targeting workflows. • Flagged security behavior that must be enforced by application logic in addition to the database schema.

COMMON KPI EVIDENCES
• Defined the user, role, user-role, and audit-log entities. • Specified unique email and primary/foreign-key relationships for account integrity. • Listed profile attributes needed by student, author, moderator, instructor, and administrator workflows. • Identified authentication and session requirements that need implementation-level validation.

NEXT WEEK COMMITMENTS	MENTOR RESPONSE
• Add and review subject, unit, topic, question, and question-bank relationships. • Confirm password-reset expiry and login-state handling rules.
