STUDENT TEAM WEEKLY REPORT

PROJECT / FEATURE	TEAM & MENTOR	WEEK / LEADER
Question Bank & Quiz Engine Quiz Definition and Question Assignment	**TEAM ID:** 1 **FACULTY MENTOR:** Mr. Rudragouda Patil	**WEEK ENDING:** 31/08/2026 **STUDENT LEADER:** Ved Panchwadkar

WORK COMPLETED	CHALLENGES / RISKS	HELP NEEDED
• Defined the `quiz` table with creator, subject, duration, randomization flag, target division, status, and timestamps. • Defined `quiz_question` as the association between quizzes and questions, with assigned marks and question order. • Added a composite primary key on quiz_id and question_id and a uniqueness rule for question order within a quiz. • Mapped the schema fields to requirements for timed quizzes, division targeting, and fixed or randomized question delivery. • Identified client-server communication and quiz-session behavior as application responsibilities to be specified alongside the database model. **Evidence: quiz and quiz_question DDL; creator/subject foreign keys; question-order and assigned-mark constraints.**	**Amber:** The quiz schema has duration but no explicit scheduled start/end timestamps. **Amber:** Randomization, timer enforcement, and division access need server-side controls; schema fields alone do not enforce them. **Green:** Quiz-to-question association and ordering fields are defined.	**Technical Guidance Request:** Review quiz lifecycle/status values, scheduling needs, server-side timer authority, and randomized question delivery rules.

INTEGRATION AND COLLABORATION
• Aligned question IDs from the question bank with quiz_question records. • Mapped quiz creator and subject fields to the user and syllabus entities. • Identified the server-side workflows needed before a quiz can be considered ready for simultaneous student attempts.

COMMON KPI EVIDENCES
• Defined quiz metadata for subject, creator, duration, randomization, and target division. • Specified per-quiz question order and marks assigned. • Included constraints to prevent duplicate quiz-question pairs and duplicate order positions. • Separated database support from still-required timer, scheduling, and access-control logic.

NEXT WEEK COMMITMENTS	MENTOR RESPONSE
• Specify persistent session/login-attempt data and lockout requirements. • Document transaction handling for concurrent question-bank submissions and quiz attempts.
