STUDENT TEAM WEEKLY REPORT

PROJECT / FEATURE	TEAM & MENTOR	WEEK / LEADER
Question Bank & Quiz Engine Secure Client-Server Workflows and Concurrency Requirements	**TEAM ID:** 1 **FACULTY MENTOR:** Mr. Rudragouda Patil	**WEEK ENDING:** 07/09/2026 **STUDENT LEADER:** Varad Tanawade

WORK COMPLETED	CHALLENGES / RISKS	HELP NEEDED
• Documented the requirement for secure client-server communication and authenticated access to quiz operations. • Outlined session tracking needs, including per-client start/end times and duration for an administrator dashboard. • Specified a login-attempt limit over a defined time window and a timeout/lockout after repeated failures. • Documented the requirement to support ongoing quiz activity for up to 50 clients simultaneously and to handle concurrent question-bank submissions for the same subject. • Reviewed the current schema against these needs; the supplied DDL does not include dedicated session or login-attempt tables. **Evidence: client-server and session requirements; concurrency scenarios; schema-gap notes for session and failed-login persistence.**	**Amber:** Session duration, per-client login attempts, lockout expiry, and active-session state need persistence or an agreed alternative. **Amber:** Concurrent submissions require transaction boundaries and conflict handling; no load-test result was supplied. **Green:** Required concurrency cases and missing persistence needs are documented.	**Technical Guidance Request:** Review a session/login-attempt storage approach, transaction isolation and conflict policy, plus the test plan for 50 concurrent clients.

INTEGRATION AND COLLABORATION
• Shared session and authentication requirements with backend/client contributors. • Mapped concurrent question-bank submission risks to question-bank uniqueness and transaction design. • Clarified that 50-client support is a requirement to validate, not a measured result in the supplied evidence.

COMMON KPI EVIDENCES
• Specified session start/end and duration data required for administration. • Defined a time-window-based login-attempt and lockout requirement. • Recorded the 50-client concurrency target and concurrent submission scenario. • Identified missing schema elements and validation work before claiming performance readiness.

NEXT WEEK COMMITMENTS	MENTOR RESPONSE
• Review quiz_attempt and student_answer structures for grading and answer review. • Resolve persistence rules for submitted versus in-progress quiz attempts.
