STUDENT TEAM WEEKLY REPORT

PROJECT / FEATURE	TEAM & MENTOR	WEEK / LEADER
Question Bank & Quiz Engine Auto-Grading and Result Management - Database Layer	**TEAM ID:** 1 **FACULTY MENTOR:** Mr. Rudragouda Patil	**WEEK ENDING:** 21/09/2026 **STUDENT LEADER:** Akansha Dhage

WORK COMPLETED	CHALLENGES / RISKS	HELP NEEDED
• Defined `quiz_attempt` records linked to a quiz and student, with start, last-saved, submit timestamps, score, status, and audit timestamps. • Defined `student_answer` fields for question responses, selected options, text answers, marks awarded, auto-grading flag, and evaluator reference. • Mapped objective grading to the correct-option flag in question_option and subjective review to text_response, marks_awarded, and evaluator_id. • Identified score summaries required by the module: total score, correct/incorrect/skipped counts, percentage, and pass/fail status; these are not all stored as separate columns in the supplied schema. • Flagged a cardinality issue: student_answer.attempt_id is UNIQUE, which would allow at most one answer row per attempt despite the composite attempt_id/question_id uniqueness rule. **Evidence: quiz_attempt and student_answer DDL; grading-field mapping; identified UNIQUE constraint conflict in student_answer.**	**Amber:** The UNIQUE constraint on student_answer.attempt_id conflicts with storing one response per question in an attempt. **Amber:** submit_time defaults to now(), so in-progress attempts need explicit lifecycle handling. **Green:** Core attempt, response, grading, and evaluator fields are represented.	**Technical Guidance Request:** Review answer-row cardinality, submission timestamp handling, score consistency, and the audit trail for manual-grade revisions.

INTEGRATION AND COLLABORATION
• Aligned attempt records with quiz IDs and student user IDs. • Mapped selected option and text response fields to question definitions and grading rules. • Shared result-history and detailed answer-review data needs with the analytics/reporting workstream.

COMMON KPI EVIDENCES
• Defined attempt-to-quiz and attempt-to-student relationships. • Specified response storage and fields for automatic versus manual grading. • Documented a blocking UNIQUE constraint issue for multi-question attempts. • Identified computed score fields and submission-state handling requiring explicit logic.

NEXT WEEK COMMITMENTS	MENTOR RESPONSE
• Define analytics queries for participation, average score, pass rate, and completion rate. • Resolve the student_answer uniqueness issue before validation with multiple questions per attempt.
