STUDENT TEAM WEEKLY REPORT

PROJECT / FEATURE	TEAM & MENTOR	WEEK / LEADER
Question Bank & Quiz Engine Security, Audit Control and Schema Review	**TEAM ID:** 1 **FACULTY MENTOR:** Mr. Rudragouda Patil	**WEEK ENDING:** 05/10/2026 **STUDENT LEADER:** Varad Tanawade

WORK COMPLETED	CHALLENGES / RISKS	HELP NEEDED
• Reviewed the supplied schema against security and audit requirements, including role assignments, account status, reset-token fields, last-login data, and audit_log. • Confirmed that audit_log can associate an action and timestamp with a user, while noting that event categories and audit coverage need defined application rules. • Recorded security requirements for hashed passwords, authenticated API access, role-based authorization, session timeout, account lockout, and optional screen-switch detection. • Flagged schema items for correction or review: the status default spelling “Unverifed”, reset_token_expiry defaulting to now(), and last_login defaulting to now() unless updated by application logic. **Evidence: schema review checklist; role/audit/reset-token field review; consolidated list of constraints and missing requirement support.**	**Amber:** Several protections are requirements, not proven by table definitions alone; API/authentication and timeout behavior need implementation testing. **Amber:** Schema inconsistencies and missing persistence should be corrected before end-to-end validation. **Green:** Core relational entities and audit-log structure provide a base for further verification.	**Technical Guidance Request:** Review the SQL corrections, role/access matrix, token-expiry semantics, and validation checklist for authentication, concurrent attempts, and reports.

INTEGRATION AND COLLABORATION
• Cross-checked user/role, question-bank, quiz, result, and audit relationships against the supplied module requirements. • Collected cross-module gaps affecting secure quiz operation and reliable results. • Prepared follow-up items for database migration review and application-level verification.

COMMON KPI EVIDENCES
• Reviewed the main security-related fields and audit-log relationship. • Identified schema corrections and requirements not represented by dedicated tables. • Compiled cross-module dependencies for schema validation and application testing. • Kept unverified features such as load testing and anti-cheating detection as validation items rather than completed outcomes.

NEXT WEEK COMMITMENTS	MENTOR RESPONSE
• Apply approved SQL corrections and run migration/schema-integrity checks. • Validate multi-question attempts, login lockout, session expiry, concurrent submissions, and analytics against test data.
