STUDENT TEAM WEEKLY REPORT

PROJECT / FEATURE	TEAM & MENTOR	WEEK / LEADER
Question Bank & Quiz Engine [Integration — Auto-Grading & Result Management]	TEAM ID : 2 FACULTY MENTOR: Mr. Rudragouda Patil	WEEK ENDING: 21/09/2026 STUDENT LEADER: Anagha Thavkar.

WORK COMPLETED	CHALLENGES / RISKS	HELP NEEDED
• **Result submission flow:** Traced the connection from the student quiz runner (student.html) to POST /api/quiz-results; each attempt record carries quizId, studentId, score, percentage, correct / incorrect / skipped counts, PASS/FAIL status and per-question responses[]. • **Student history & review:** Reviewed how student.html reads GET /api/quiz-results (merged with locally stored attempts) to feed Quiz History and the Detailed Attempt Review. • **Manual grading path:** Mapped the Author/Admin Manual Evaluation screens to the role-protected POST /api/quiz-results/grade endpoint, which replaces the attempt record and writes an audit-log entry. • **Admin results view:** Reviewed admin.html Assessments & Results (search, status and quiz filters, CSV export) against GET /api/quiz-results. • **Test scripts:** test_api_endpoints.py (Quiz Results GET/POST) and simulate_100_quiz_students.py (concurrent POST /api/quiz-results) available in integration/ for end-to-end checks.	• **Storage gap:** Results are kept in the server in-memory registry and browser localStorage, not in PostgreSQL (quiz_attempt, student_answer). Records are lost on restart or /api/reset. • **Server-side grading not wired:** QuizAttemptServiceImpl (auto-grade, manual marks) exists but no AppServer endpoint calls it; scoring currently runs in the browser. • **Schema defect:** In Database.sql, student_answer has UNIQUE on attempt_id alone, which would allow only one answer per attempt once DB storage is connected. • **Access control:** GET/POST /api/quiz-results has no authentication check; history also falls back to first-name matching. • Pass mark is fixed at 60% in student.html; test run outputs not yet attached.	• **Decision needed from Backend team & mentor**: Should POST /api/quiz-results be connected to QuizAttemptService so attempts are stored in PostgreSQL, or should the final demo use the in-memory registry? • Database team to confirm the student_answer constraint fix.

INTEGRATION AND COLLABORATION	COMMON KPI EVIDENCES
Interfaces Used: POST/GET /api/quiz-results, POST /api/quiz-results/grade, apiClient auth headers, student.html, author.html, admin.html, AppServer.java. **Dependencies (open):** • Backend team — expose QuizAttemptService grading/results through AppServer. • Database team — correct student_answer constraint in Database.sql. • Frontend team — confirm final result payload fields and pass criteria. **Pipeline Learnings:** Current flow is student.html → POST /api/quiz-results → AppServer in-memory registry → GET /api/quiz-results → history, review and admin views. The PostgreSQL path (Service → DAO → quiz_attempt / student_answer) is built but not yet connected.	• **Foundational Behavior:** simulate_100_quiz_students.py submits 100 concurrent results; PROJECT_SUMMARY.md reports 100/100 success at ~79.67 ms. • **Continuous Integration:** start_app.sh compiles the backend, launches AppServer and checks GET /api/health. • **Instrumentation:** Manual-grading actions are written to the audit log (AuditLogs registry). • **Collaborative Delivery:** Integration README to be updated; it lists /api/attempts/* endpoints that AppServer does not register.

NEXT WEEK COMMITMENTS	MENTOR RESPONSE
• Anagha Thavkar: Connect POST /api/quiz-results to QuizAttemptService for PostgreSQL storage. • Pratiksha Chavan: Fix student_answer constraint with Database team and re-initialise schema. • Kartik Manoj: Add authentication to result endpoints; run test_api_endpoints.py and the 100-student script and capture outputs. • Shruti Chavan: Update Integration README with the actual results/grading endpoints.
